

DeBox

DeBox desktop environment is a new way to make a desktop on Debian based O.S.

Why DeBox?

Is just a mix of various Linux programs (awn, openbox, pcmanfm) that create a new fast and i think beautiful desktop environment. And is GPL...

Why you call it DeBox?

DeBox is Debian + openbox (or *box)

Few tips for the 1.2 version.

- The basic file is the /usr/bin/DeBoX that handle every aspect of this desktop. The very first time that you login at the Debox desktop you must logout to full activate the DeBox desktop (is just a script bug). The openbox menu is active at the beginning (right click and "Exit") so... use it. In the second login you can deactivate it from the pcmanfm options menu (Edit>Preferences>Desktop>Show Wm menus...).

- Once you install it you have a dock that you can put every application that you need (just go to /usr/share/applications and then drag and drop the application in your dock).

- If you use a nvidia card put this lines at your /etc/X11/xorg.conf

```
Section "Extensions"
```

```
Option "Composite" "enable"
```

```
EndSection
```

- If you have a ATI video card see the site of Compiz <http://www.compizfusion.org/> (use it also for the nvidia cards).

- Relax and be ready for the DeBoX Desktop...
